

Thank you for choosing **ANAC Diagnosis**.

This kit includes: one sample bottle with syringe, one cap, one hose, one pre-paid envelope, one identification sheet and this manual.

## Instructions to take an oil sample

Take the sample while the oil is hot immediately after you have shut down your engine!  
Make sure the oil has stayed at least 3 000 km in the engine (since the last oil change).

### A. How to take a sample between two oil changes (without doing an oil change)

① Do the sampling through the oil gauge : insert the hose in the gauge pipe untill the middle of the oilbath (corresponds approximately at the minimum on the oilstick).

② Put the hose on the syringe.

③ Pull the syringe and fill the bottle completely (if necessary in several times).

### B. How to take an oil sample in case of an oil change

Clean the surface around the oil cap.

Pull the syringe.

Let the first oil flow away.

Take the sample in the middle of the flow and let the oil flow directly in the bottle and put the cap on immediately .

④ Close the bottle immediatly with the cap.

⑤ Break the pull stick.

⑥⑦ Fill in the identification sheet and cut the lower part of the sheet.

⑧ Put the bottle (make sure to close it well) and the identification sheet in the pre -stamped envelope and send it all to ANAC.

*Your diagnosis report will be sent to you by e-mail within 48 hours after reception of the sample in the ANAC laboratory.*
